OCCUPATIONAL EXPOSURE AND RISK ASSESSMENT

EXPOSURE AND RISK ASSESSMENT/CHARACTERIZATION

Purpose

In this document, which is for use in EPA's development of the Endosulfan Review Reregistration Eligibility Decision Document (RED), EPA presents the results of its fourth review of the potential human health effects of occupational exposure to endosulfan.

Criteria for Conducting Exposure Assessments

An occupational and/or residential exposure assessment is required for an active ingredient if (1) certain toxicological criteria are triggered <u>and</u> (2) there is potential exposure to handlers (mixers, loaders, applicators, etc.) during use or to persons entering treated sites after application is complete. For endosulfan, both criteria are met.

Summary of Toxicity Concerns Relating to Occupational Exposures

Acute Toxicology Categories

Table 1 below presents the acute toxicity categories as outlined in the Report of the Hazard Identification Assessment Review Committee (February 25, 2002).[1]

Table 1: Acute Toxicity Categories for Endosulfan Technical

Guidelines	Test	MRID	Results	Toxicity Category
81-1	Acute Oral Toxicity	00038307	LD_{50} =40.38 mg/kg in ♂ LD_{50} =9.58 mg/kg in ♀	I
81-2	Acute Dermal Toxicity	41183503	LD_{50} = 2000 mg/kg	III
81-3	Acute Inhalation Toxicity	41183504	LC_{50} = 0.16- 0.5 mg/L	I
81-4	Primary Eye Irritation	255157	Eye irritant (Residual opacity at day 13)	I
81-5	Primary Dermal Irritation	00038309 00128649	Non-Irritant Slightly Irritant	IV IV
81-6	Dermal Sensitization	00136994	Not a dermal sensitizer	

Other Endpoints of Concern

The Report of the Hazard Identification Assessment Review Committee (February 25, 2002)[1] indicates that there are toxicological endpoints of concern for endosulfan. The endpoints used in assessing the risks for endosulfan are presented in the Table 2.

Table 2: Endpoints for Assessing Occupational and Residential Risks for Endosulfan[1]

Route / Duration	NOAEL (mg/kg/day)	Effect	Study	Uncertainty Factors and Safety Factors
Short and Intermediate term Dermal (one day to one month; one month to several months)	12.0	mortality in females at 27 mg/kg/day (LOAEL)	21-day dermal toxicity study in rats	Interspecies: 10x Intraspecies: 10x FQPA: 10x
Short and Intermediate term Inhalation (one day to one month; one month to several months)	0.2	Decreased body-weight gain and decreased leukocyte counts in males and increased creatinine values in females at 0.002 mg/L (0.40 mg/kg/d)	21-day inhalation study in rats.	Interspecies: 10x Intraspecies: 10x FQPA: 10x

FQPA Safety Factor

The FQPA Committee memo dated February 14, 2002[2] concluded that the **10x** FQPA Safety Factor for endosulfan should be **retained.** Previously (November 20, 1998), the Committee recommended a 3x FQPA Safety Factor due to the lack of a DNT. At the current meeting, however, the Committee recommended that the 10x FQPA Safety Factor should be retained because there was not reliable data available to address the following concerns or uncertainties raised by the following matters: 1) evidence for increased susceptibility of young rats, 2) additional evidence for endocrine disruption, 3) uncertainty regarding the neuroendocrine effects in the young, and 4) the need for a DNT. The Committee determined that the FQPA safety factor (10x) is applicable for all populations when assessing acute and chronic dietary exposure. There are no longer any residential uses for this chemical and FQPA safety factors do not apply to occupational workers, therefore, the FQPA Safety factor was not used in this exposure assessment.

Cancer Determination

The carcinogenicity issue has been considered by the Health Effects Division-Cancer Peer Review Committee. The Committee agreed that "there was no evidence of carcinogenicity" for endosulfan.[1]

SUMMARY OF USE PATTERNS AND FORMULATIONS

Deletion of Uses

Since the previous version of the endosulfan occupational and residential risk assessment dated February 2, 2000, a 6f notice has been issued and finalized after a 30 day comment period.[3] The following uses have been deleted from the endosulfan technical labels at the request of the endosulfan task force and will not be assessed in this document:

- All home and residential uses

- Endosulfan in the form of fogger, insecticidal smoke, impregnated material, dust, pressurized liquid, and pressurized spray.

- Food: Citrus (except non-bearing and nursery stock), artichoke, safflower, sugar beet, watercress, alfalfa, clover/forage (except grown for seed), corn (field/forage), endive, evening primrose, garden beets, garlic, and rapeseed (canola).

- Non-food: Indoor household uses, wood protectant, unseasoned forest products, ULV application, Douglas Fir, Juniper, Locust, Maple, and Willow (forestry use), forestry plantings.

- Commercially Grown Greenhouse/Out-of-Doors Ornamental Plants (Except for Commercially Grown Outdoor Trees and Shrubs)–Including but not Limited to Aster, Carnation, Chrysanthemum, Evening Primrose, Iris, Lilies, Marigold, Poinsettia, Snapdragon, Tulips, Croft Lily, German Lily, Hydrangea, Periwinkle, Rhododendron, Rose, Rhododendron Canescens, Flowering Peach/Nectarine, Leatherleaf Fern, Holly Fern.

Occupational- and Non-Occupational-Use Products

Products containing endosulfan are intended for occupational use. Residential uses will not be included in this assessment, because of the above mentioned deletion. Occupational uses include applications to agricultural food and non-food crops, ornamental and/or shade trees, fruit and nut crops, ornamental herbaceous trees, and shrubs.[4,5]

Type of Pesticide/Targeted Pests

Endosulfan [6, 7, 8, 9, 10-hexachloro-1, 5, 5a, 6, 9, 9a, hexahydro-6, 9-methano-2, 4, 3-benzodioxathiepin-3-oxide] is a broad spectrum insecticide/acaricide. Examples of the type of pests that endosulfan is used to control include (but are not limited to) the following:

- **Agricultural**: Meadow spittlebug, Army cutworm, Aphids, Bean leaf skeletonizer, Cowpea curculio, Cucumber beetle, Flea beetle, Green stink bug,

Leafhoppers, Mexican bean beetles, Cabbage looper, Cabbage worm, Cabbage aphid, Cucumber beetles, Whitefly, Cutworms, Diamondback moth, Corn earworm, Boll weevil, Bollworm, Lygus bugs, Thrips, Melonworm, Pickleworm, Rindworm, Squash beetle, Squash bug, Blister beetle, Potato beetle, Rose chafer, Pepper maggot, Cinch bug, Crown mite, June bug, Harlequin bug, Grape phylloxera, and Grape leafhopper.

- **Orchards**: Aphids (including Apple aphids, Black cherry aphid, Black peach aphid, Green peach aphid, Rosy apple aphids, Rusty plum aphids, Wooly apple aphids), Apple rust mites, Green fruitworm, Tarnished plant bug, Tentiform leafminers, Whitefly leaf hoppers, Peachtree borer, Peach twig borer, Plum rust mite, Bud moth, Bud mites, Twig mites, Filbert aphid, Filbert leafroller, Filbert bud mite, Black pecan aphic, Pecan nut casebearer, and Spittlebug.

- **Ornamental Trees and Shrubs**: Leather leaf fern borer, Aphids, Cyclamen mite, Rose chafer, Whitefly, Dogwood borer, Lilac borer, Colley spruce gall adelgid, Douglas fir needle midge, Walnut aphid, and Stink bug.

Formulation Types and Percent Active Ingredient

Endosulfan is formulated for occupational use as a technical grade manufacturing product (95 percent active ingredient [ai]), emulsifiable concentrate (9 percent to 34 percent active ingredient), and a wettable powder (1 percent to 50 percent active ingredient).[5,6] The wettable powder is frequently packaged in water soluble bags.

Registered Use Sites

Occupational-Use Sites

Endosulfan has been registered for occupational-use on terrestrial food and feed crops, indoor food crops, and terrestrial non-food crops. For ease and brevity, the occupational crops use sites in this assessment have been grouped as follows:

- **Vegetables and Field Crops**: alfalfa (seed only), barley, beans (dry and succulent), blueberries, broccoli, brussel sprouts, cabbage, carrots, cauliflower, celery, clover (seed only), collards, cotton, corn (fresh only), cucumbers, eggplants, grapes, kale, kohlrabi (seed only), lettuce, melons, mustard greens, oats, peas, peppers, pineapples, potatoes, pumpkins, radish (seed only), rutabaga (seed only), rye, spinach, squash, sweet potatoes, strawberries, tobacco, tomato, turnip, and wheat.

- **Fruit and Nut Trees (orchard crops),** including apples, apricots, almonds, cherries, filberts, macadamia nuts, nectarines, pecans, peach, pear, pistachio nuts, plums, prunes, and walnuts.

- **Ornamental Trees and Shrubs,** including shade trees, citrus (non-bearing and nursery stock), shrubs, nursery stock, Christmas tree plantations, and woody plants.

- **Root dip,** including cherry, peaches, and plum roots and crowns, and whole strawberry plants.

- **Agriculture in greenhouses** (tomatoes and ornamental trees and shrubs).

Application rates[4,5]

The crop groupings with their corresponding maximum label application rates are as follows (both formulations unless noted, EC = emulsifiable concentrate, WP = wettable powder formulations):

- **Agricultural crops,** including vegetables and field crops: alfalfa (seed only, 1 lb ai/A EC), barley, rye, oats and wheat (0.75 lb ai/A), beans and tomatoes (1 lb ai/A), clover (0.5 lbs ai/A EC), blueberries (1.5 lb ai/A), broccoli, cabbage, collard, lettuce, melons, and mustard greens (1lb ai/A or 2 lb ai/A for seed), brussel sprouts, carrots, cauliflower, celery, cucumbers, eggplants, peas, peppers, potatoes, pumpkins, spinach, and squash (1 lb ai/A), cotton and corn (fresh only) (1.5 lb ai/A), grapes (1.5 lb ai/A or 0.005 lb ai/gallon), kale (0.75 lb ai/A or 2 lb ai/A for seed), kohlrabi, radish, turnip and rutabaga (2 lb ai/A seed only), strawberries, pineapples and sweet potato (2 lb ai/A), and tobacco (1.5 lb ai/A WP, 1 lbs ai/A EC).

- **Fruit and nut trees (orchard crops),** including apples (2.5 lb ai/A or 0.005 lb ai/gal), apricots, peach, and nectarines (3 lb ai/A or 0.0025 lb ai/gal), almonds and pistachio nuts (2.5 lb ai/A or 0.025 lb ai/gallon), cherries, pears, plums, and prunes (2.5 lb ai/A or 0.04 lb ai/gallon), filberts (hazelnuts 2lb ai/A or 0.005 lb ai/gallon), macadamia nuts (3.0 lb ai/A or 0.01 lb ai/gallon), pecans (3 lbs ai/A or 0.0075 lb ai/A), and walnuts (2 lb ai/A or 0.02 lb ai/gallon WP, 2.5 lb ai/A or 0.04 lb ai/gallon EC). **Note:** A currently registered label (EPA reg # 34704-516) contains a higher application rate (7.5 lb ai/A) for pecans and macadamia nuts than is listed above. At this time only the 3.0 lb ai/A rate for pecans and macadamia nuts is being supported and this assessment therefore only assesses these crops for a 3.0 lb ai/A maximum application rate. **All currently registered endosulfan labels should be amended after the risk mitigation phase of endosulfan to reflect the new 3.0 lb ai/A maximum application rate.**

- **Ornamental Trees and Shrubs,** including shade trees, citrus (non-bearing and nursery stock), shrubs, nursery stock, Christmas tree plantations, and woody plants (1 lb ai/A or 0.01 lb ai/gallon).

- **Root dip,** including cherry, peaches, and plum roots and crowns (0.05 lb ai/gallon) and whole strawberry plants (0.01 lb ai/gallon EC).

- **Bark Treatment,** includes apricot, cherry, grapes, nectarines, peach, plums and prunes (see above for application rates, applied with high pressure handwands and rights-of-way sprayers).

Methods and Types of Equipment Used for Mixing, Loading, and Application

Equipment for commercial use includes groundboom sprayer, fixed-wing aircraft, chemigation (potatoes only), airblast sprayer, rights-of-way sprayer, low pressure handwand, high pressure handwand, backpack sprayer, and dip treatment.

OCCUPATIONAL EXPOSURE AND RISK ASSESSMENT/CHARACTERIZATION

Occupational Handler Exposures and Risks

Handler Scenarios

EPA has determined that there are potential exposures to mixers, loaders, applicators, and other handlers during usual use-patterns associated with endosulfan. Based on the use patterns, 21 major occupational exposure scenarios were identified for endosulfan: (1a) mixing/loading liquid formulations for aerial application; (1b) mixing/loading liquid formulation for chemigation; (1c) mixing/loading liquid formulations for groundboom application; (1d) mixing/loading liquid formulations for airblast application; (1e) mixing/loading liquid formulations for rights-of-way sprays; (1f) mixing/loading liquid formulations for plant and root dip; (2a) mixing/loading wettable powders for aerial application; (2b) mixing/loading wettable powders for groundboom application; (2c) mixing/loading wettable powders for airblast application; (2d) mixing/loading wettable powder for rights-of-way spray application; (2e) mixing/loading wettable powders for plant and root dip; (3) applying sprays with aerial equipment; (4) applying sprays with a groundboom sprayer; (5) applying sprays with an airblast sprayer; (6) applying sprays with a rights-of-way sprayer; (7) applying dip treatment to roots, or whole plants; (8) mixing/loading/applying liquids with a low pressure hand wand; (9) mixing/loading/applying wettable powders with a low pressure handwand; (10) mixing/loading/applying liquids with a high pressure hand wand; (11) mixing/loading/applying liquids with backpack sprayer; and (12) flagging aerial spray applications.

Current endosulfan labels PPE requirements range from no PPE listed to long sleeved shirt and long pants, waterproof gloves, shoes, socks, chemical resistant headgear, respirator with either an organic vapor removing cartridge with a prefilter or canister approved for pesticides. Mixer and loaders must also wear a chemical resistant apron.

Handler Exposure Data - Chemical Specific Data

6

Handler Study

In support of the reregistration process for endosulfan, AgrEvo USA submitted a worker exposure study for review by EPA. The 1987 study, *Exposure of Mixer/Loader/ Applicators to Thiodan® 3EC Insecticide Applied to Fruit Trees by Airblast Equipment in California* was originally submitted as MRID No. 410485-02. The registrant subsequently made revisions and resubmitted the study in 1990 as MRID No. 417152-01. EPA determined that both the original and revised study do not meet Agency guidelines for acceptability under Series 875, Occupational and Residential Test Guidelines. The following data gaps and deficiencies were found:[6]

- **Study Design:** The study was conducted at 2 sites (3 replicates each) instead of 3 sites (5 replicates each), as required by Series 875, Occupational and Residential Test Guidelines. Also, it should be noted that the biological monitoring data are invalid because the main excretory pathway for endosulfan is through feces (media not monitored in study) and not the urine (media monitored in study). This was identified in the endosulfan reregistration standard.

- **Inhalation:** No air pump calibration/operation data were provided. Field recovery samples did not appear to be exposed to environmental conditions (i.e., no air was drawn through the charcoal tubes) during the actual field sampling trials. Breakthrough/volatilization validation data are lacking.

- **Dermal:** Hand wash field recovery sample results are low and highly variable. Also, 3 samples were lost and not analyzed concurrently with the remaining field samples. Since hand exposure accounts for a large percentage of the total exposure, the quality of the hand wash recovery samples are necessary to evaluate dermal exposure.

Based on these deficiencies, the data in MRIDs 410485-02 and 417152-01 are not used in the assessment. Instead, surrogate-based exposure assessments for each scenario, including airblast, were developed, where appropriate data were available, using the Pesticide Handlers Exposure Database (PHED) Version 1.1.[7]

Registrant Submitted Risk Assessment

The registrant also submitted a risk assessment titled, "Evaluation of the Human Hazards and Risks Associated with the Application of Endosulfan." dated March 1989 (MRID 410485-01).[8] This submission was not used in this risk assessment for the following reasons: the exposure data used was from the above study (MRID 417152-01) which was found to be unacceptable, acres treated per day used were not justified and vary widely from the HED standard values, and the monkey dermal penetration study which is critical in interpreting the biological monitoring data was not acceptable.

HED has reviewed Aventis' "Submission of an Application Exposure Assessment for Endosulfan and an Evaluation of Possible Endocrine Effects in Mammalian Species" dated August 4, 1999 (MRID 449391-01)[9] and concludes that the submission does not follow standard HED policies or use HED standard default values.   HED calculates high-end single-day exposures to occupational workers, based on maximum label application rates and standard values for the number of acres that can be treated in a single day by various types of agricultural equipment. These standard acres treated per day values are representative of most crops treated with endosulfan, including both low (strawberries) and high (potatoes) acreage crops, and are protective of commercial applicators who may treat multiple farms or fields in one day. Although the 1992 U.S. Census of Agriculture data used by Aventis does represent the national average crop acreage per farm, it is only representative of individual farmers and not of commercial applicators, who are likely to treat more acres in a day than individual growers.

Aventis' exposure assessment incorporates a 50% reduction factor to dermal exposure for workers, based on the label requirement for chemical resistant headgear. HED does not assign a reduction factor to dermal exposure due to the use of chemical resistant headgear. Although HED agrees that chemical resistant headgear may reduce pesticide exposure, a protection factor has not been established for the use of such headgear, due to a lack of data. Therefore, HED does not quantitatively reduce exposure risk estimates to take chemical resistant headgear into account.

HED notes that the revised dermal endpoints are based on the 21-dermal study in the rat for the short-term and intermediate-term (postapplication only) exposure durations. This study replaces the two-year chronic toxicity/carcinogenicity study in rats that was originally used to assess for intermediate-term dermal exposure. HED has considered Aventis' submission for inclusion in the endosulfan assessment, but because of the aforementioned discrepancies, it will not be included in this assessment.

Handler Exposure Data - Surrogate Data

Table 3 summarizes the caveats and parameters specific to the surrogate data used for each scenario and corresponding exposure/risk assessment. These caveats include the source of the data and an assessment of the overall quality of the data. The assessment of data quality is based solely on the number of observations and the available quality control data. The quality control data are based on a grading criteria established by the PHED Task Force.[10]

The PHED Task Force is comprised of representatives from the U.S. EPA, Health Canada, the California Department of Pesticide regulation, and member companies of the American Crop Protection Association. PHED is a software system consisting of two parts: a database of measured exposure values for workers involved in the handling of pesticides under actual field conditions and a set of computer algorithms used to subset and statistically summarize the selected data. Currently, the database contains values for over 1,700 monitored individuals (i.e., replicates).

Users select criteria to subset the PHED database to reflect the exposure scenario being evaluated.   The subsetting algorithms in PHED are based on the central assumption that the magnitude of handler exposures to pesticides are primarily a function of activity (e.g., mixing/loading, applying), formulation type (e.g., wettable powders, granulars), application method (e.g., aerial, groundboom), and clothing scenarios (e.g., gloves, double layer clothing).

Once the data for a given exposure scenario have been selected, the data are normalized (i.e., divided by) by the amount of pesticide handled resulting in standard unit exposures (milligrams of exposure per pound of active ingredient handled). Following normalization, the data are statistically summarized. The distribution of exposure values for each body part (e.g., chest upper arm) is categorized as normal, lognormal, or "other" (i.e., neither normal nor lognormal). A central tendency value is then selected from the distribution of the exposure values for each body part. These values are the arithmetic mean for normal distributions, the geometric mean for lognormal distributions, and the median for all "other" distributions. Once selected, the central tendency values for each body part are composited into a "best fit" exposure value representing the entire body.

The unit exposure values calculated by PHED generally range from the geometric mean to the median of the selected data set.   While data from PHED provide the best available information on handler exposures, it should be noted that some aspects of the included studies (e.g., duration, acres treated, pounds of active ingredient handled) may not accurately represent labeled uses in all cases. HED has developed a series of tables of standard unit exposure values for many occupational scenarios that can be utilized to ensure consistency in exposure assessments (PHED Surrogate Exposure Guide, August 1998).[7]

Handler Exposure Assumptions

The following assumptions and factors were used to complete this exposure assessment:

- Calculations were completed for a range of maximum application rates for specific crops recommended by the available endosulfan labels and the LUIS report. These rates were assessed in order to bracket risk levels associated with the various use patterns.

- Average body weight of an adult handler was assumed to be 70 kg.

- Daily (8-hour workday) acres and volumes (as appropriate) to be treated in each scenario include:[12]
   – A range of the possible number of acres that can be treated with endosulfan aerially on cotton, small grains (wheat, barley, oats and rye), corn and alfalfa in one day are given in this assessment for risk mitigation decision purposes. Exposures were estimated for handlers using 1,200 and 350 acres per day for aerial equipment. The use of 1,200 acres treated in one day by either the mixer/loader or the applicator is considered a reasonable high end estimate, because these crops are high acreage field crops.   This maximum acres treated aerially per day is based on published scientific literature, surveys, knowledge of agricultural practices, and calculated acreage estimates. Until actual use pattern data for endosulfan use on cotton, small grains, alfalfa, and corn are supplied,

9

1,200 acres maximum treated per day for either the aerial mixer/loader or the aerial applicator is considered to be a reasonable estimate.[11]

-- 350 acres for aerial applications to all agricultural crops other than small grains (wheat, barley, oats and rye), cotton, corn and alfalfa;

-- 350 acres for flaggers supporting aerial applications;

-- For groundboom equipment use on cotton, small grains (wheat, barley, oats and rye), alfalfa and corn, since they are large acreage crops, a range of 200 acres per day to 80 acres per day was used. For all other crops, 80 acres was used.

-- 40 acres for airblast applications on agricultural crops, and 10 acres for airblast on ornamentals;

-- 1000 gallons for high pressure handwands and rights-of-way sprayers

-- 40 gallons for low pressure handwands and backpack sprayers

• Due to a lack of scenario-specific data, HED sometimes calculates unit exposure values using generic protection factors that are applied to represent the use of personal protective equipment (PPE) and engineering controls. This assessment used a 50 percent protection factor to account for a double layer of clothing, a 80 percent protection factor over baseline unit exposure values to represent the use of a dust/mist respirator and a 90 percent protection factor over baseline inhalation unit exposure values to represent use of an organic vapor removing respirator (currently required on the label).

• Rights-of-way sprayers, low pressure handwands and high pressure handwands are considered the application techniques used to apply liquids and wettable powders in tree bark treatments. The low and the high pressure handwands are also assumed to be used in greenhouses and in drench treatments.

• The duration of exposure for handlers of endosulfan is assumed to be short-term only (one day to one month).

Handler Exposure Calculations

Handler exposure assessments were completed using a baseline exposure scenario and, if required, increasing levels of risk mitigation (PPE and engineering controls) in an attempt to achieve an appropriate margin of exposure. The baseline scenario generally represents a handler wearing long pants, a long-sleeved shirt, no respirator, and no chemical-resistant gloves (there are exceptions pertaining to the use of gloves, and these are noted). Baseline exposures are presented in Table 4. Table 5 includes short-term exposure/risk calculations for minimum PPE and maximum PPE. Table 6 includes short-term exposure/risk calculations at engineering controls. Table 7 summarizes the risks for all mitigation levels.

The calculations of daily dermal and inhalation exposure to endosulfan by handlers were used to calculate the daily dose, and therefore the risks, to those handlers. Daily dermal exposure was calculated using the following formula:

Daily Dermal Exposure [mg ai/day] = Unit Exposure [mg ai/lb ai] x Use Rate [lb ai/A] x Daily Acres or Daily Acres Treated or Gals Used [A/day or Gal/day]

Potential daily inhalation exposure was calculated using the following formula:

Daily Inhalation Exposure [mg ai/day] = Unit Exposure [µg ai/lb ai] x Conversion Factor [1 mg/1000 µg] x Use Rate [lb ai/A] x Daily Acres Treated or Gals Used [A/day or Gal/day]

The potential short-term inhalation and dermal doses were calculated using the following formulae:

Daily Inhalation Dose [mg ai/kg/day] = Daily Inhalation Exposure [mg ai/day] x [1/body weight (kg)]

Daily Dermal Dose [mg ai/kg/day] = Daily Dermal Exposure [mg ai/day] x [1/body weight (kg)]

Since the dermal endpoint was based on a dermal study, a dermal absorption factor is not necessary. The following formulae were used in the calculation of the short-term dermal and inhalation MOEs.

Dermal MOE = [Dermal NOAEL (mg/kg/day)] ÷ [Short-term Dermal Dose (mg/kg/day)]

Inhalation MOE = [Inhalation NOAEL (mg/kg/day)] ÷ [Short-term Inhalation Dose (mg/kg/day)]

A short-term dermal NOAEL of 12.0 mg/kg/day was used in the calculation of MOEs. The short-term inhalation NOAEL of 0.2 mg/kg/day was calculated by converting the inhalation NOAEL of 0.001 mg ai/L in Wistar rats. Dermal and inhalation MOEs were not aggregated because the end effects seen at the LOAEL were different.

The inhalation endpoint for short-term inhalation risks, 0.001 mg ai/L, was converted to an oral equivalent dose using the HED Route-to-Route Extrapolations memo[12] dated October 9, 1998, presented below:

Inhalation NOAEL (mg/kg/day) = [NOAEL (mg ai/L) x RV (L/hr) x D x A x AF x 5 days/week] ÷ BW x 7 days/week

where:

RV = respiratory volume (8.46 liters of air respired per hour at rest)
D = duration of daily animal exposure (based on a 6-hour/day study)
BW = mean body weight in kg of Wistar rat (0.187 kg)
A = absorption - the ratio of deposition and absorption in the respiratory tract compared to absorption by the oral route, assumed to be 1
AF = activity factor - animal default is 1

An MOE of 100 has been identified as the target risk level for short-term occupational exposure scenarios.

Table 3: Occupational Exposure Scenario Descriptions for the Use of Endosulfan

Exposure Scenario (Number)	Data Source	Standard Assumptions[a] (8-hr work day)	Comments[b]
Mixer/Loader Descriptors			
Mixing/Loading Liquid Formulations (1a/1b/1c/1d/1e/1f)	PHED V1.1	1200 acres for aerial application on small grains (wheat, barley, oats and rye), cotton, corn, and alfalfa, 350 acres for aerial application on all other crops and chemigation application; 200 acres for groundboom application to cotton, wheat, alfalfa, and corn, 80 acres for groundboom application to all other agricultural crops, 40 acres for airblast application on ag crops and 10 acres on ornamentals and 1000 gallons for rights-of-way spray application to ornamentals and as a tree bark treatment.	**Baseline:** Hands, dermal, and inhalation = AB grades. Hands = 53 replicates; Dermal = 72 to 122 replicates; and Inhalation = 85 replicates. High confidence in hands/dermal, and inhalation data. No protection factor was needed to define the unit exposure value. **PPE:** The same dermal data are used as for baseline, coupled with a 50% protection factor to account for an additional layer of clothing, with gloved hand data. A 10-fold PF (i.e., 90% PF) was applied to the baseline inhalation data. Hands = AB grades. Hands = 59 replicates. High confidence in hands data. **Engineering Controls:** Hands, dermal, and inhalation = AB grades. Hands = 31 replicates; Dermal= 16 to 22; and Inhalation = 27 replicates. High confidence in hands/dermal, and inhalation data. No protection factor was needed to define the unit exposure value. Engineering controls based on closed mixing/loading.
Mixing/Loading Wettable Powder Formulations (2a/2b/2c/2d/2e)	PHED V1.1	1200 acres for aerial application on small grains (wheat, barley, oats and rye), cotton, corn, and alfalfa, 350 acres for aerial application on all other crops and chemigation application; 200 acres for groundboom application to cotton, wheat, alfalfa, and corn, 80 acres for groundboom application to all other agricultural crops, 40 acres for airblast application and 1000 gallons for rights-of-way spray application to ornamentals and as a tree bark treatment.	**Baseline:** Hands, dermal, and inhalation = ABC grades. Hands = 7 replicates; Dermal = 22 to 45 replicates; and Inhalation = 44 replicates. Low confidence in hands/dermal, and medium confidence in inhalation data. No protection factor was needed to define the unit exposure value. **PPE:** The same dermal data are used as for baseline, coupled with a 50% protection factor to account for an additional layer of clothing, with gloved hand data. A 10-fold PF (i.e., 90% PF) was applied to the baseline inhalation data. Hands = ABC grades. Hands = 24 replicates. Medium confidence in hands data. **Engineering Controls**: Hands = AB grades; dermal and inhalation = all grades. Hands = 5 replicates; Dermal = 6 to 15 replicates; and Inhalation = 15 replicates. Low confidence in the hands, dermal and inhalation data. No protection factor was needed to define the unit exposure value. Engineering controls are based on water soluble packets.
Applicator Descriptors			
Applying Sprays with Aerial Equipment (3)	PHED V1.1	1200 acres for aerial application on small grains (wheat, barley, oats and rye), cotton, corn, and alfalfa and 350 acres for aerial application on all other crops	**Engineering Controls:** Hands = AB grade, dermal and inhalation = ABC grade. Hands= 34 replicates, dermal = 24 to 48 replicates, and inhalation = 23 replicates. Medium confidence in hands, dermal, and inhalation data. No protection factor was needed to define the unit exposure value.
Applying Sprays with a Groundboom Sprayer (4)	PHED V1.1	200 acres for groundboom application to cotton, small grains (wheat, barley, oats and rye), alfalfa, and corn, 80 acres for groundboom application to all other agricultural crops.	**Baseline**: Hands, dermal, and inhalation = AB grades. Hands = 29 replicates, dermal = 23 to 42 replicates, and inhalation = 22 replicates. High confidence in hands, dermal, and inhalation data. No protection factor was needed to define the unit exposure value. **PPE**: The same dermal data are used as for baseline, coupled with a 50% protection factor to account for an additional layer of clothing, with gloved hand data. Hands = ABC grade, 21 replicates, and medium confidence. A 10-fold (i.e., 90% PF) was applied to the baseline inhalation data to account for the use of an organic vapor removing respirator. **Engineering Controls**: Dermal and hands = ABC grades. Hands = 16 replicates, dermal = 20-31 replicates. Medium confidence in both hands and dermal. Inhalation is AB grade, 16 replicates, and high confidence.

Table 3: Occupational Exposure Scenario Descriptions for the Use of Endosulfan (Continued)

Exposure Scenario (Number)	Data Source	Standard Assumptions[a] (8-hr work day)	Comments[b]
Applying Sprays with an Airblast Sprayer (5)	PHED V1.1	40 acres for application to fruit/nut and 10 acres for ornamental trees	**Baseline:** Hands, dermal , and inhalation = AB grades. Hands = 22 replicates, dermal = 32 to 49 replicates, and inhalation = 47 replicates. High confidence in hands, dermal, and inhalation data. No protection factor was needed to define the unit exposure value. **PPE:** The same dermal data are used as for baseline, coupled with a 50% protection factor for an additional layer of clothing, with gloved hand data. A 10-fold PF (i.e., 90% PF) was applied to the baseline inhalation data. Hands = AB grades. Hands = 18 replicates. High confidence in hands data. **Engineering Controls:** Hands and dermal = AB grade, and inhalation = ABC grade. Back calculated from glove data assuming gloves provide 90% protection. Dermal = 27 to 30 replicates; and inhalation = 9 replicates. Low confidence in dermal data; and low confidence in inhalation data (based on low replicates).
Applying Sprays with a Rights-of-way Sprayer (6)	PHED V1.1	1000 gallons for application to trees in city streets, or as a tree bark treatment.	**Baseline:** Hand data are AB grade, dermal data are ABC grade, and inhalation data are A grades. Hand = 16 replicates; dermal = 4 to 20 replicates; and inhalation = 16 replicates. Low confidence in hand/dermal data, and high confidence in inhalation data. No protection factor was needed to define the unit exposure value. **PPE:** The same dermal data are used as for the baseline, coupled with a 50% protection factor to account for an additional layer of clothing, and chemical resistant glove data were used for hands. Hand data are AB grades with 4 replicates and low confidence level. The same inhalation data are used as for the baseline coupled with an 90% protection factor to account for the use of an organic vapor removing respirator. **Engineering Controls:** Not feasible for this scenario.
Applying Dip Treatment to Roots, or Whole Plants (7)	No Data	100 gallons for root dip, and whole strawberry plant dip	No Data
Mixer/Loader/Applicator Descriptors			
Mixing/Loading/Applying Liquids with a Low Pressure Handwand (8)	PHED V1.1	40 gallons for treatment to agricultural crops, including greenhouse crops and tobacco seed bed drench; bark treatment of dormant fruit trees; and indoor and outdoor ornamental treatment	**Baseline**: Dermal and inhalation = ABC grades; hands= all grades. Dermal = 9 to 80 replicates, inhalation = 80 replicates, and hands = 70 replicates. Low confidence in hands and dermal; and medium confidence in inhalation data. No protection factor was needed to define the unit exposure value. **PPE**: The same dermal data are used as for baseline coupled with a 50% protection factor to account for an additional layer of clothing. A 10-fold PF (i.e., 90% PF) was applied to the baseline inhalation data. Hands = ABC grades. Hands = 10 replicates. Low confidence in hands data. **Engineering Controls**: Not feasible for this scenario.
Mixing/Loading/Applying Wettable Powders with a Low Pressure Handwand (9)	PHED V1.1	40 gallons for treatment to agricultural crops, including greenhouse crops and tobacco seed bed drench; bark treatment of dormant fruit trees; and indoor and outdoor ornamental treatment	**Baseline:** Hand data are AB grades, dermal are ABC grades, and inhalation data are ABC grades. Hand = 15 replicates, back calculated from glove data assuming a 90% protection factor from gloves; dermal = 16 replicates; and inhalation = 16 replicates. Low confidence in dermal, and medium confidence in hand and inhalation data. No protection factor was needed to define the unit exposure value. **PPE:** The same dermal are used as for the baseline, coupled with a 50% protection factor to account for an additional layer of clothing. The same inhalation data as for baseline are used, coupled with an 90% protection factor to account for the use of an organic vapor removing respirator. **Engineering Controls:** Not feasible for this scenario.

Exposure Scenario (Number)	Data Source	Standard Assumptions[a] (8-hr work day)	Comments[b]
Mixing/Loading/Applying Liquids using High Pressure Sprayer (10)	PHED V1.1	1000 gallons for treatment to agricultural crops, bark treatment of dormant fruit trees; and indoor and outdoor ornamental treatment	**Baseline:** Hands = C grade; dermal = AB grades; and inhalation = A grades. Hands = 13 replicates, back calculated from glove data using a 90% protection factor; dermal = 7 to 13 replicates; and inhalation= 13 replicates. Low confidence in hands, dermal and inhalation data. No protection factor was needed to define the unit exposure. **PPE:** The same dermal data are used as for baseline, coupled with a 50% protection factor to account for an additional layer of clothing. The same inhalation data as for baseline are used, coupled with a 90% protection factor to account for the use of a organic vapor removing respirator. **Engineering Controls:** Not feasible for this scenario.
Mixing/Loading/Applying Liquids with a Backpack Sprayer (11)	PHED V1.1	40 gallons for treatment to agricultural crops, including greenhouse crops and tobacco seed bed drench; bark treatment of dormant fruit trees; and indoor and outdoor ornamental treatment	**Baseline**: No data for dermal and hands. Inhalation= A grade. Inhalation=11 replicates. Low confidence in inhalation data. **PPE**: Dermal= AB grade and hands= C grade. Dermal= 9 to 11 replicates, and hands = 11 replicates. Low confidence in dermal and hands data. A 10-fold PF (i.e., 90% PF) was applied to the baseline inhalation data. A 50% PF was applied to dermal to account for double layer clothing. **Engineering Controls**: Not feasible for this scenario.
Flagger Descriptors			
Flagging Aerial Spray Applications (12)	PHED V1.1	350 acres	**Baseline:** Hands, dermal, and inhalation = AB grades. Dermal = 18 to 28 replicates; Hands = 30 replicates; and Inhalation = 28 replicates. High confidence in dermal, hands, and inhalation data. **PPE**: The same dermal data are used as for baseline coupled with a 50% protection factor to account for an additional layer of clothing. Hands = AB grades. Hands= 6 replicates. Low confidence in hands data. A 10-fold PF (i.e., 90% PF) was applied to the baseline inhalation data to account for the use of an organic vapor removing respirator. **Engineering Controls**: Enclosed groundboom data are used as a surrogate for engineering controls for flaggers. Dermal and hands = ABC grades; Inhalation = AB grades. Dermal = 20 to 31 replicates; Hands = 16 replicates; and Inhalation = 16 replicates. Medium confidence in dermal and hands data. High confidence in inhalation data.

Footnotes:

a   Daily amount treated are based on Science Advisory Council for Exposure Policy # 9.1.[11]

b   "Best Available" grades as defined in EPA's OPPTS Series 875, Occupational and Residential Exposure Test Guidelines, Group A. Best available grades are assigned as follows: matrices with grades A and B data <u>and</u> a minimum of 15 replicates; if not available, then grades A, B and C data and a minimum of 15 replicates; if not available, then all data regardless of the quality and number of replicates. Data confidence are assigned as follows:

High   = grades A and B and 15 or more replicates per body part

Medium   = grades A, B, and C and 15 or more replicates per body part

Low   = grades A, B, C, D and E <u>or</u> any combination of grades with less than 15 replicates

Footnotes:

a   Baseline dermal unit exposure represents long pants, long sleeved shirt, no gloves, except for scenarios 9 and 11 which include gloves, open mixing/loading, open cab/tractor. Values from PHED Surrogate Exposure Guide - August 1998.

b   Baseline inhalation unit exposure represents no respirator. PHED Surrogate Exposure Guide - August 1998.

c   Crops named are index crops which are chosen to represent all other crops at or near that application rate for that use. See the application rates listing in the use summary section of this document for further information on application rates used in this assessment.

d   Application rates assessed are a range of maximum application rates found on endosulfan labels and the LUIS report. The rates are meant to bracket listed maximum application rates.

e   Daily amount treated are based on Science Advisory Council for Exposure Policy # 9.1.[11]

f   Baseline Dermal Dose (mg/kg/day) = (Dermal Unit Exposure (mg/lb ai) * Application rate (lb ai/acre) * Acres treated (acres/day)) / Body weight (70 kg).

g   Baseline Inhalation Dose (mg/kg/day) = (Inhalation Unit Exposure (µg/lb ai) * (1mg/1000 µg) Conversion factor * Application rate (lb ai/A) * Acres treated (acres/day)) / Body weight (70 kg).

h   Dermal MOE = Dermal NOAEL (3 mg/kg/day)/Short Term Dermal Dose (mg/kg/day). Short-term Target MOE = 100.

i   Inhalation MOE = Inhalation NOAEL (0.2 mg/kg/day)/ Daily Inhalation Dose (mg/kg/day). Short-term Target MOE = 100. ND = No data.

Footnotes:
a   Minimum PPE dermal unit exposure values represents single layer of clothing and chemical resistant gloves, open mixing/loading, and open cab tractor.
b   Daily Dermal Dose (mg/kg/day) = ((Dermal Unit Exposure (mg/lb ai) x Application Rates (lb ai/A and lb ai/gallon.) x Area Treated per day (acres or gallons)) / Body Weight (70 kg)) .
c   Short-term PPE dermal MOE = short-term dermal NOAEL (12.0 mg/kg/day) / dermal dose (mg/kg/day). Target MOE = 100.
d   Minimum PPE inhalation unit exposure represents use of dust/mist respirator.
e   Daily Inhalation Dose = ((Inhalation Unit Exposure (µg/lb ai) x Application Rates (lb ai/A and lb ai/gallon) x Area Treated per day (acres or gallons)* (1 mg/1000 µg)) / Body Weight (70 kg))
f   Short-term inhalation MOE = short-term inhalation NOAEL (0.2 mg/kg/day) /inhalation dose (mg/kg/day). Short-term Target MOE = 100.
g   Maximum PPE dermal unit exposure values represents double layer of clothing and chemical resistant gloves, open mixing/loading, and open cab tractor.
h   Maximum PPE inhalation unit exposure represents use of an organic vapor removing respirator.
-    Scenario's calculated MOE exceeds the target MOE at the previous level of mitigation. (MOE > 100)
Bolded MOE values show a risk of concern at the highest possible level of mitigation for the corresponding scenario. ND = No data.

Footnotes:

a   Crops named are index crops which are chosen to represent all other crops at or near that application rate for that use. See the application rates listing in the use summary section of this document for further information on application rates used in this assessment.

b   Application Rates are based on the maximum application rates listed on the endosulfan labels.

c   Daily amount treated are based on Science Advisory Council for Exposure Policy # 9.1.[11]

d   Short- term Dermal MOE = Short- term NOAEL (mg/kg/day)/ Daily Dermal Dose (mg/kg/day).

e   Short-term MOE = Short- term NOAEL (mg/kg/day)/ Daily Inhalation Dose (mg/kg/day).

f   Baseline clothing: long pants, long sleeved shirt, shoes, socks. Chemical resistant gloves are included for mixing/loading/applying liquids with a backpack sprayer and wettable powders with a low pressure handwand (scenarios 9 and 11).

g   Minimum PPE clothing: Baseline clothing plus dust/mist respirator, and chemical resistant gloves.

h   Maximum PPE clothing: Baseline clothing plus organic vapor respirator, double layer of clothes, and chemical resistant gloves.

i   Engineering controls: Enclosed mixing/loading, closed cab, truck or cockpit. Baseline level clothing. Chemical resistant gloves for airblast sprayer application and mixing/loading liquid formulation (scenarios 1 and 5).

-     Scenario's calculated MOE exceeds the target MOE at the previous level of mitigation. (MOE > 100)

NF = Not feasible for this scenario (no available engineering controls). ND = No data.

Bolded MOE values show a risk of concern at the highest possible level of mitigation for the corresponding scenario.

Summary of Risk Concerns for Handlers, Data Gaps, and Confidence in Exposure and Risk Estimates

Dermal and inhalation risks for handlers were assessed separately since there are different toxicological endpoints assigned to these exposures.[1] Handler exposure to endosulfan are expected to be short-term only (1 day to one month). The target MOE for the short-term exposure duration is 100.

Handler Scenarios with Risk Concerns

Dermal (Short-term)

The calculations of short-term dermal risk indicate that MOEs are **greater than or equal to 100** at **baseline** for the following scenarios:

- (4) Applying sprays with a groundboom sprayer for all application rates assessed.

- (5) Applying sprays with a groundboom sprayer at 1.0 lb ai/acre and 10 acres/day.

- (6) Applying sprays with rights-of-way sprayer at 0.005 lb ai/gallon and 1000 gallons/day.

- (9) Mixing/loading/applying wettable powders with a low pressure handwand at 0.005 lb ai/gallon and 1000 gallons/day.

- (11) Mixing/loading/applying liquids with a backpack sprayer for all application rates assessed.

- (12) Flagging aerial spray applications at 0.5 and 2.0 lbs ai/acre and 350 acres/day.

The calculations of short-term dermal risk indicate that MOEs are **less than or equal to 100 at the highest feasible level of mitigation** for the following scenarios:

- (1a) Mixing/loading liquids for aerial application at 3.0 lbs ai/acre and 350 acres/day and at 1.5 lbs ai/acre and 1,200 acres/day.

- (2a)   Mixing/loading wettable powders for aerial application at 3.0 lbs ai/acre and 350 acres/day and at 0.75 and 1.5 lbs ai/acre and 1,200 acres/day.

- (3) Applying sprays with aerial equipment at 1.5 lbs ai/acre and 1200 acres/day.

- (6) Applying sprays with a rights-of-way sprayer 0.04 lb ai/gallon and 1000 gallons/day.

- (10) Mixing/loading/applying liquids with a high pressure handwand sprayer at 0.01 and 0.04 lbs ai/gallon and 1000 gallons/day.

Inhalation (Short-term)

29

The calculations of short-term inhalation risk indicate that MOEs are **greater than or equal to 100** at **baseline** for the following scenarios:

- (1c) Mixing/loading liquids for groundboom application at 0.5 lbs ai/acre and 80 acres/day.

- (1d) Mixing/loading liquids for airblast application at l.0 lb ai/acre and 10 acres/day and at 2.0 lbs ai/acre and 40 acres/day.

- (1e) Mixing/loading liquids for rights-of-way sprayer application for all assessed application rates.

- (1f) Mixing/loading liquids for plant and root dip at 0.05 lbs ai/gallon and 100 gallons/day.

- (4) Applying sprays with a groundboom sprayer at 0.5 and 2.0 lbs ai/acre and 80 acres/day and at 0.75 lbs ai/acre and 200 acres/day.

- (5) Applying sprays with an airblast sprayer at 1.0 lb ai/acre and 10 acres/day.

- (6) Applying sprays with a rights-of-way sprayer at 0.005 lbs ai/acre and 1000 gallons/day.

- (8) Mixing/loading/applying liquids with a low pressure handwand sprayer for all assessed application rates.

- (11) Mixing/loading/applying liquids with a backpack sprayer for all assessed application rates.

- (12) Flagging aerial spray applications at 0.5 lbs ai/acre and 350 acres/day.

The calculations of short-term inhalation risk indicate that MOEs are **less than 100 at the highest feasible level of mitigation** for the following scenarios:

- (1a) Mixing/loading liquids for aerial application at 3.0 lbs ai/acre and 350 acres/day and 1.5 lbs ai/acre and 1,200 acres/day.

- (2a) Mixing/loading wettable powders for aerial application at 2.0 and 3.0 lb ai/acre and 350 acres/day and at 0.75 and 1.5 lb ai/acre and 1,200 acres/day.

- (3) Applying sprays with aerial equipment at 1.5 lb ai/acre and 1,200 acres/day.

- (10) Mixing/loading/applying liquids with a high pressure handwand at 0.04 lb ai/acre and 1000 acres/day.

Data Gaps

Data gaps exist for the following scenarios:

- (7) Applying dip treatments to trees and roots or whole plants.

- No exposure data exists for mixing/loading/applying wettable powders with a high pressure handwand and a backpack sprayer. These two scenarios are expected to have risks of concern since similar scenarios assessed in this document, mixing/loading wettable powders and mixing/loading/applying liquids with a high pressure hand wand, have risks of concern.

Data Quality and Confidence in Assessment

Several issues must be considered when interpreting the occupational exposure risk assessment. These include:

- Several generic protection factors were used to calculate handler exposures (e.g., 90 percent PF over baseline for inhalation unit exposure to account for use of an organic vapor removing respirator). These protection factors are considered conservative, but have not been completely evaluated by HED.

- Low confidence data, based on PHED grading criteria, were used to calculate the risks to handlers from the following scenarios for any body part and/or level of mitigation: Mixing/loading wettable powders, applying sprays with an airblast sprayer, applying sprays with a rights-of-way sprayer, mixing/loading/applying liquids and wettable powders with a low pressure handwand, mixing/loading/applying liquids with a high pressure handwand and backpack sprayer, and flagging aerial applications.

Occupational Handler Summary

Of the 21 identified occupational handler exposure scenarios, 5 of them are a risk of concern, having calculated MOEs less than target MOE of 100, at the highest level of mitigation for **short-term dermal** exposure. For **short-term inhalation** exposure, 4 of the 21 identified occupational handler exposure scenarios are a risk of concern, having calculated MOEs exceeding the target MOE of 100, at the highest level of mitigation. Three scenarios lack data to assess their risk.

Data is needed to assess the following occupational handler scenarios: applying dip treatments to trees and roots or whole plants and mixing/loading/applying wettable powders with a backpack sprayer and a high pressure handwand.

Occupational Postapplication Exposures and Risks

Postapplication Exposures and Assumptions

EPA has determined that there are potential short- and intermediate-term postapplication exposures to individuals entering treated fields. Current endosulfan labels restricted entry interval (REI) requirement is 24 hour REI with the following early entry PPE required: coveralls, waterproof gloves, shoes, socks and chemical resistant headgear for overhead exposures.

For the purpose of conducting this assessment, crops were grouped in order to assign the most representative dislodgeable foliar residue (DFR) data to the crops. The crop groups listed below were chosen because appropriate residue data were available (see description of postapplication DFR study below: MRID 444031-02). The crop groups and corresponding surrogate residue data sources are as follows:

- **Tree Crops**: DFR data for peaches were used, based on a study using an application rate of 3 lb ai/acre, to determine exposure from postapplication activities associated with all tree crops (15 tree crops other than peaches). This application rate is consistent with the application rates for most fruit and nut trees. For the crops where the application rates were not 3 lbs ai/acre, the DFR data were adjusted (linear) to the appropriate application rate for the individual crops.

- **Grape** Harvesting, Girdling and Irrigating: This scenario is based on DFR data for grapes using an application rate of 1.5 lbs ai/acre. This is the labeled application rate for grapes.

- **Field Crops:** DFR data for melons were used and were assumed to be representative of exposure from postapplication activities associated with all the remaining crops registered for endosulfan (37 crops other than melons) except for grapes and tree crops. The DFR data were based on an application rate of 1 lb ai/acre. However, most of the labeled application rates for these crops range from 0.25 to 3 lb ai/acre. Thus, the DFR data were adjusted (linear) to the appropriate application rate for the individual crops.

Chemical-specific DFR Data

A DFR study was conducted for endosulfan and its metabolites, beta-endosulfan and endosulfan sulfate. The study evaluated dislodgeable residue dissipation for endosulfan applied to peaches, grapes, and melons (MRID No. 444031-02).[13] In summary, the dislodgeable foliar residue study completed in support of the regulatory requirements for endosulfan did not completely meet the criteria contained in Series 875, Occupational and Residential Test Guidelines. This conclusion is based on the following issue: the DFR study was performed in only one geographical area. Series 875, Occupational and Residential Test Guidelines, recommend that, "In general, DFR samples should be collected from at least three geographically distinct locations per formulation type;" While the Endosulfan Task Force contends that California is the worst case climate for the least amount of residue dissipation, further DFR studies may need to be conducted in the areas where there is the highest use of endosulfan. Other issues were identified in HED's review of the

DFR study,[13] but these were addressed in a supplemental report submitted by the Endosulfan Task Force.[14]

Despite the uncertainty listed above, HED recommended that the data from this DFR study be used in assessing the appropriate postapplication exposure from agricultural activities using endosulfan. The study is appropriate for regulatory use in assessing postapplication residues on fruit trees and low growing fruits crops. The DFR data from this study were used in assessing postapplication risks to endosulfan.

Peaches - Endosulfan (Phaser 3EC and Phaser 50WP) was applied to plots of mature fruit at a site located in California using an "Air-O-Fan" airblast sprayer which operated at 150 PSI and sprayed approximately 400 gallons per acre. The test substance was applied at a rate of 3 lb ai/acre. A single application was made. (This may underestimate exposures following repeated applications as indicated on the label.) Foliage samples were collected at days 0 1, 3, 5, 7, 10, 14, 17, 21, 24, and 28 postapplication. Each sample consisted of 40 leaf discs that were 5 cm^2. Leaf samples were collected in glass jars and transported to the laboratory on blue ice. The samples were dislodged the same day as collected and analyzed for levels of alpha-endosulfan, beta-endosulfan, and endosulfan sulfate. Laboratory recovery samples were within the acceptable range. The residue data for peaches are shown in Table 9.

For the purposes of this assessment, a regression analysis was conducted using the natural log-transformed DFR data from this study. Average DFR data from each of the 4 trials done for both formulations were used in the regression analysis. To predict residue levels on peaches, the following equation was used:

$y = mx + b$ where:

x	=	days postapplication;
m	=	slope of the regression line;
b	=	constant; and
y	=	residue on day x.

For Phaser 3EC applied to peaches, m is -0.09131 and b is -1.91431. The R value for these data is 0.84. For Phaser 50WP applied to peaches, m is -0.09728, b is -0.55653, and R value is 0.96. The predicted DFRs on days 1 through 41 are shown in Table 11 for Phaser 50WP. The predicted DFRs on days 1 through 53 are shown in Table 12 for Phaser 3EC. This study used an application rate of 3 lbs ai/acre and a single application. This is consistent with the labeled application rates for peaches and other fruit and nut trees. For the crops where the application rates were not 3 lbs ai/acre, the DFR data were adjusted (linear) to the appropriate application rate for the individual crops. Since the correlation coefficients (R value) for these data are 0.84 and 0.96, a linear method of predicting the DFR data is considered representive the distribution of the data. This fit is also considered adequate based on the uncertainties that result from the use of data from only one geographic location and the extrapolation of the peach DFR data to 15 other tree crops.

Grapes - Endosulfan (Phaser 3EC and Phaser 50WP) was applied to grapes at a location in California. The pesticide was applied by an Allis Chalmers G III U-Boom Grape Sprayer, at a rate of 1.5 lbs ai/acre. Two applications were made. Foliage samples were collected from the experimental plots at 0, 1, 3, 5, and 7 days after the first application and at days 0, 1, 3, 5, 7, 10, 14, 17, 21, 24, and 28 days after the second application. Foliage samples consisted of 40 leaf discs that were 5 cm^2. Leaf samples were collected in glass jars and transported to the laboratory on blue ice. The samples were dislodged the same day as collected and analyzed for levels of alpha-endosulfan, beta-endosulfan, and endosulfan sulfate. Laboratory recovery samples were within the acceptable range. The residue data for grapes are shown in Table 9.

For the purposes of this assessment, a regression analysis was conducted using the natural log-transformed DFR data after the second application from this study to predict residue levels, as shown above. Average DFR data from each of the 4 trials done for both formulations were used in the regression analysis. For Phaser 50WP on grapes, m is -0.07169, b is -0.17214, and R value is 0.86. The predicted DFRs on days 1 through 66 are shown in Table 11 for Phaser 50WP. For Phaser 3EC on grapes, m is -0.10004 and b is -1.66886, after the second application. The R value for these data is 0.72.   Since the R value is low, all of the replicates were analyzed in a regression analysis for the Phaser 3EC use on grapes. This analysis yielded a higher R value of 0.81 with a m of -0.1268 and a b of-1.583. The actual residue data for all four replicates for the use of the Phaser 3EC on grapes are presented in Table 10. The predicted DFRs on days 1 to 67 from the use of the 4 replicates of actual residues are shown in Table 10 for Phaser 3EC. This study used an application rate of 1.5 lbs ai/acre and two applications. This is consistent with the labeled application rate for grapes. Since the correlation coefficients (R value) for these data are 0.86 and 0.81, a linear method of predicting the DFR data is considered representative the distribution of the data. This fit is also considered adequate based on the uncertainties that result from the use of data from only one geographic location.

Melons - Endosulfan (Phaser 3EC and Phaser 50WP) was applied to melons at a site in California. Pesticide was applied by an Allis Chalmers GII sprayer (appears to be similar to a groundboom sprayer) at a rate of 1 lb ai/acre. Two applications were made. The melons were immature at the time of both applications. Foliage samples were collected by leaf punch at 0, 1, 3, 5, and 7 days after the first application and at days 0, 1, 3, 5, 7, 10, 14, 17, 21, 24, and 28 days after the second application. Foliage samples consisted of 40 leaf discs that were 5 cm^2. Leaf samples were collected in glass jars and transported to the laboratory on blue ice. The samples were dislodged the same day as collected and analyzed for levels of alpha-endosulfan, beta-endosulfan, and endosulfan sulfate. Laboratory recovery samples were within the acceptable range. However, field recovery samples were not analyzed and no storage stability study was conducted. The residue data for melons are shown in Table 9.

For the purposes of this assessment, a regression analysis was conducted using the natural log-transformed DFR data after the second application from this study to predict residue levels, as shown above. Average DFR data from each of the 4 trials done for both formulations were used in the regression analysis. For melons, m is -0.12341 and b is -1.15627 for Phaser 3EC. The R value for these data is 0.87. For Phaser 50WP on melons, m is -0.13955, b is -0.35023, and R value is 0.94. The estimated DFRs on days 1 through 38 are shown in Table 11 for Phaser 50WP. The

estimated DFRs on days 1 through 48 are shown in Table 12 for Phaser 3EC. This study used an application rate of 1 lbs ai/acre and two applications. However, most of the labeled application rates for these crops range from 0.25 to 3 lb ai/acre. Thus, the DFR data were adjusted (linear) to the appropriate application rate for the individual crops. Since the correlation coefficients (R value) for these data are 0.94 and 0.87, a linear method of predicting the DFR data is considered representive the distribution of the data. This fit is also considered adequate based on the uncertainties that result from the use of data from only one geographic location and the extrapolation of the melon DFR data to 37 other crops.

Other Postapplication Data

It should be noted that another DFR study (MRID 403039-01) was conducted for endosulfan.[15] This study examined DFR residues on apples, apricots, processing tomatoes, and cherry tomatoes. The study was unacceptable for the following reasons:

- The field recovery data for apples and processing tomatoes were unacceptably low and field recovery data for apricots and cherry tomatoes were variable;

- The lab recovery data for all crops were highly variable;

- Storage stability data were not provided; apple, apricot, and processing tomato samples were stored for approximately 4 months and cherry tomato samples were stored for an unspecified period of time prior to analysis; and

- Meteorological data were incomplete.

Therefore, this study is unacceptable and was not used in estimating postapplication exposures in this document. All postapplication exposure estimates were based on MRID# 444031-02. Table 8 compares the half lives of the two endosulfan DFR studies. The half lives from the unacceptable study were similar to or higher than the half lives from the study used to determine postapplication exposure in this assessment. This demonstrates that the DFR data from the unacceptable study would result in restricted entry interval calculations similar to or even longer than the ones calculated in this assessment.

Table 8. Comparison of DFR Data Half Lives for Wettable Powder Formulation.

DFR Study Used in Assessment 444031-02		Unacceptable Study 403039-01	
Crop	Half Life (days)[a]	Crop	Half Life (days)[a]
Grapes	9.7	Apples	15.2
Melons	5.0	Apricots	11
Peaches	7.1	Processing Tomatoes	12.8
		Cherry Tomatoes	5

a Half life (days) = -ln (2)/m where m = slope of predicted residues from the regression analysis.

Exposure and Risk Calculations

The DFR data was adjusted for other application rates using the following equation:

$$\textit{Adjusted DFR } (\mu g/cm^2) = \frac{\textit{Study DFR } (\mu g/cm^2) \textit{ x crop application rate } (lbsai/A)}{\textit{study application rate } (lbs\ ai/A)}$$

Short/intermediate-term doses and MOEs were calculated as follows:

$$ADD = [DFR\ x\ Tc\ x\ ET\ x\ mg/1000\ \mu g] \div BW$$

where:

ADD =   average daily dose (mg/kg/day);
DFR =   dislodgeable foliar residue ($\mu g/cm^2$);
Tc   =   transfer coefficient (cm^2/hr);
ET   =   exposure time (8 hours/day); and
BW   =   body weight (70 kg).

and

$$MOE = NOAEL/ADD$$

The crops were grouped according to similar application rates, transfer coefficients, and DFR data used. The assumptions used for both short and intermediate term postapplication exposures are as follows:

Assumptions

- The maximum transfer coefficients for each crop were used to determine the highest possible postapplication exposure and restricted entry intervals. Scouting and irrigation transfer coefficients were also used to determine possible exemptions to the restricted entry intervals calculated for the highest postapplication exposures.

- The transfer coefficients used in this assessment are from the Agricultural Re-entry Task Force (ARTF) database. An interim transfer coefficient policy was developed by HED's Science Advisory Council for Exposure using the ARTF database (policy # 3.1). It is the intention of HED's Science Advisory Council for Exposure that this policy will be periodically updated to incorporate additional information about agricultural practices in crops and new data on transfer coefficients. Much of this information will originate from exposure studies currently being conducted by the ARTF, from the further analysis of studies already submitted to the Agency, and from the studies in the published scientific literature.[16]

- Exposure time is assumed to be 8 hours per day. This represents a typical work day.

- The average body weight of 70 kg is used.

- Postapplication workers are assumed to be exposed continuously to endosulfan, since endosulfan is used on over 50 crops and an occupational worker could move from treated field to treated field. This is especially possibly when application is repeated every seven days for two to three applications, as is allowable on the present labels. Therefore, short- and intermediate-term risks are assessed.

Table 9. Actual Average Dislodgeable Foliar Residues of Endosulfan in Melons, Peaches, and Grapes.

Application	Sample Interval (DAT)[b]	DFR Residues (μg/cm^2)[a]					
		Melon		Peach		Grapes

	28	0.02	0.03	0.01	0.04	LOQ	0.13

Footnotes:

LOQ- DFR residue is below limit of quantification (0.01 μg/cm^2) .

NA- not applicable. Peaches have only one application of pesticide.

[a] DFR residues from crops are obtained from application of either two labeled products (Phaser® EC or Phaser® WP), and table entries are averages of triplicate samples taken at each sample interval.

[b] DAT = days after treatment.

Table 10. Actual Dislodgeable Foliar Residues of Endosulfan in Grapes Using the EC Formulation.

Footnote:

[a] DAT = days after treatment.

Short- and Intermediate-term Postapplication Exposures and Risks

A dose and a MOE are determined from the declining predicted DFR values until the target MOE of 100 is reached for every crop for both formulations. Since the short and intermediate- term dermal endpoints are the same, the data summarized in Table 13 are for both short- and intermediate-term exposures. The NOAEL used in the short- and intermediate-term assessment is 12.0 mg/kg/day and the target MOE is 100.

Table 13. Endosulfan Short- and Intermediate-term Occupational Postapplication Assessment.

			1,300	Irrigating and scouting	melon	0	1.1	0.31	75	260
						2	0.8	NA	100	NA

Footnotes:

NA = Not applicable (MOE > 100 on a previous day).

Day 0 = day of application after sprays have dried (12 hours).

a   Crops were grouped according to similar application rates, transfer coefficients, and surrogate DFR data sources.

b   WP = wettable powder formulation

c   EC = emulsifiable concentrate formulation

d   maximum application rates as stated on current endosulfan labels.

e   Transfer Coefficients from Science Advisory Council on Exposure Policy 3.1.[16]

f   Activities from Science Advisory Council on Exposure Policy 3.1.[16] Every activity listed may not occur for every crop in the group.

g   The appropriate DFR surrogate data source for each crop was determined by the similarity in crop types and quality of the data.

h   DAT is "days after treatment" (0 days = 12 hours after application).

i   Predicted DFR values were obtained through study data of endosulfan residues on the foliage of melons, peach trees and grapes in CA (MRID 444031-02). DFR values were adjusted proportionately to reflect different application rates. The adjusted DFR = (study DFR X crop application rate)/study application rate.

j   MOE = NOAEL (mg/kg/day) / Dermal dose (mg/kg/day). Target MOE = 100.

Non-Occupational Exposures

   Non-occupational exposures to endosulfan, such as from spray drift, were not included in this assessment. The Agency is developing policy on how to appropriately assess potential risks from spray drift, and after the policy is in place, the Agency will reevaluate the potential non-occupational risks from endosulfan.

Data Gaps

   If the registrant is interested in refining endosulfan's restricted entry intervals, additional DFR data and/or worker exposure monitoring data may be submitted.

Occupational Postapplication Summary

       For short and intermediate term exposure to the emulsifiable concentrate formulation, the day after treatment when the calculated MOE equals or exceeds the target MOE of 100 ranges from 0 days (day of application) for pruning pecan trees to 17 days for detasseling corn at an application rate of 1.5 lbs ai/acre. For short and intermediate term esposures to the wettable powder formulation, the day after treatment when the calculated MOE equals or exceeds the target MOE of 100 ranges from 0 days pruning pecan trees to 30 days for girdling grapes at an application rate of 1.5 lbs ai/acre. Occupational postapplication risks from dermal exposure are of concern. See Table 14 for a summary.

Table 14. Summary of Short and Intermediate- term Postapplication Exposure.
